THE COEFFICIENT OF LINEAR thermal expansion (CTE,  $\alpha$ , or  $\alpha \pm 1$ ) is a material property that is indicative of the extent to which a material expands upon heating.

Heavy metals are generally defined as metals with relatively high densities, atomic weights, or atomic numbers. The criteria used, and whether metalloids are included, vary depending on the author and context. In metallurgy, for example, a heavy metal may be defined on the basis of density, whereas in physics the distinguishing criterion might be atomic number, while a chemist would likely be ...

Liquid metal embrittlement, also known as liquid metal induced embrittlement, is a phenomenon of practical importance, where certain ductile metals experience drastic loss in tensile ductility or undergo brittle fracture when exposed to specific liquid metals. Generally, a tensile stress, either externally applied or internally present, is needed to induce embrittlement.

Shinohara et al. [1] pointed out that the precipitation of the  $\delta$ -phase was a diffusion-controlled phase transformation in 25% Cr-20% Ni stainless steel, and that the Cr atom had an important effect on the acceleration of the precipitation rate of the  $\delta$ -phase. The precipitation rate of the  $\delta$ -phase in  $\delta$ - $\gamma$ -ferrite was higher (by about 100 times) than that of  $\delta$ - $\gamma$ -austenite [1].
