For problem P2. We need to be a set of functions of .In the figure on the right, we have illustrated a triangulation of a 15 sided polygonal region in the plane (below), and a piecewise linear function (above, in color) of this polygon which is linear on each triangle of the triangulation; the space would consist of functions that are linear on each triangle of the chosen triangulation.

Back to top A cell is a flexible type of variable that can hold any type of variable. A cell array is simply an array of those cells. It's somewhat confusing so let's make an analogy. A cell is like a bucket. You can throw anything you want into the bucket: a string, an integer, a double, an...

Suggested initial step size, specified as the comma-separated pair consisting of 'InitialStep' and a positive scalar.InitialStep sets an upper bound on the magnitude of the first step size that the ODE solver tries.. If you do not specify an initial step size, then the solver bases the initial step size on the slope of the solution at the initial time point, tspan(1).

Size of rectified images, specified as the comma-separated pair consisting of 'OutputView' and the character vector 'full' or 'valid'.When you set this parameter to 'full', the rectified images include all pixels from the original images.When you set this value to 'valid', the output images are cropped to the size of the largest common rectangle containing valid pixels.

An alternative is to run the script from outside Octave by calling Octave from your operating system shell. Unlike calling the script from inside Octave, this also allows you to pass arguments from the shell into the script, which the script can access using the argv command: \$ octave the-script.m arg1 arg2
