Background: Although classic type A and B aortic dissections have been well described, less is known about the natural history of penetrating atherosclerotic ulcers of the thoracic aorta. This study differentiates penetrating ulcer from aortic dissection, determines the clinical features and natural history of these ulcers, and establishes appropriate correlates regarding optimal treatment.

A granuloma is a compact aggregate of histiocytes (macrophages).<sup>5</sup> The histiocytes in granulomas are often described as "epithelioid." Epithelioid histiocytes have indistinct cell borders and elongated, sole-shaped nuclei, as opposed to the well-defined cell borders and round, oval, or kidney bean-shaped nuclei of ordinary histiocytes.

In situ pulmonary adenocarcinoma (AIS) "previously included in the category of "bronchioloalveolar carcinoma" (BAC) is a subtype of lung adenocarcinoma. It tends to arise in the distal bronchioles or alveoli and is defined by a non-invasive growth pattern. This small solitary tumor exhibits pure alveolar distribution (lepidic growth) and lacks any invasion of the surrounding normal lung.

## **Adenocarcinoma in situ of the lung - Wikipedia**

Multiple cystic lung disease represents a diverse group of uncommon disorders that can present a diagnostic challenge due to the increasing number of diseases associated with this presentation. High-resolution computed tomography of the chest helps to define the morphological aspects and distribution of lung cysts, as well as associated findings.
