any steps that may be possible to limit or reduce the number of soil borne diseases in humans. For example, the misuse of soil by humans which can lead to soil degradation processes might also enhance soil borne disease incidence, for example through increasing wind erosion and so the amount of airborne spores from the soil.

of soilborne pathogens and diseases: soil type, texture, pH, moisture, temperature, and nutrient levels are among them. Soil is a porous mixture of inorganic particles, organic matter, air, and water. Soil texture, which results from the size of mineral particles, and soil structure, which is the arrangement of soil particles into groups (aggre-

Types of soil-borne diseases. Soil-borne diseases in the garden include pre and post-emergence damping-off, like *Fusarium*, *Pythium* and *Rhizoctonia* species, root rot, including *Phytophthora*, vascular wilts caused by fungi including *Verticillium* and nematodes. Pre-emergence damping-off is where young seedlings decay in the soil before they appear above the soil surface.

These STHs are considered Neglected Tropical Diseases (NTDs) because they inflict tremendous disability and suffering yet can be controlled or eliminated. Soil-transmitted helminths live in the intestine and their eggs are passed in the feces of infected persons.

Coakley (1995) stated that disease development may increase, decrease or remain stable depending on the particular pollutant and host-pathogen interaction. Similarly, Manning and von Tiedemann (1995) recognized that, at that time, there was limited knowledge about observed and predicted impacts of climate change on plant epidemics.

Soil-borne diseases will continue to frustrate backyard gardeners. As always, the best defense is a good offense. Planting vegetable varieties with resistance to common diseases can help to both limit the occurrence of problems and the spread of soil-borne pathogens.

Summer death is not a soil-borne disease but symptoms of the disease may be confused with other soil-borne diseases. The disease causes severe losses on susceptible varieties, particularly in beans grown in inland districts. Many suitable resistant cultivars are now available. Cause: bean summer death virus.
